1 Saving the world from bad beans: deployment-time confinement checking 83%

Dave Clarke , Michael Richmond , James Noble
ACM SIGPLAN Notices , Proceedings of the 18th ACM SIGPLAN conference on Object-oriented programing, systems, languages, and applications October 2003
Volume 38 Issue 11

The Enterprise JavaBeans (EJB) framework requires developers to preserve architectural integrity constraints when writing EJB components. Breaking these constraints allows components to violate the transaction protocol, bypass security mechanisms, disable object persistence, and be susceptible to malicious attacks from other EJBs. We present an object confinement discipline that allows static verification of components' integrity as they are deployed into an EJB server. The confinement rules are ...

2 A taxonomy of computer program security flaws 80%

Carl E. Landwehr , Alan R. Bull , John P. McDermott , William S. Choi
ACM Computing Surveys (CSUR) September 1994
Volume 26 Issue 3

An organized record of actual flaws can be useful to computer system designers, programmers, analysts, administrators, and users. This survey provides a taxonomy for computer program security flaws, with an Appendix that documents 50 actual security flaws. These flaws have all been described previously in the open literature, but in widely separated places. For those new to the field of computer security, they provide a good introduction to the characteristics of security flaws and how they ...

3 Security issues surrounding programming languages for mobile code: JAVA vs. Safe-Tcl 77%

Stefanos Gritzalis , George Aggelis
ACM SIGOPS Operating Systems Review April 1998
Volume 32 Issue 2

JAVA is claimed to be a system programming language having a number of advantages
